E BOOKING – MOVIE TICKET BOOKING WEBSITE

ABSTRACT

E Booking is a user-friendly movie ticket booking website designed to make the process of exploring movies and booking tickets simple and convenient. The website allows users to browse currently showing, featured, and upcoming movies, view movie details, select a show date and time, and proceed with a booking through an easy-to-use interface.

The project is developed using HTML, CSS, and JavaScript. HTML provides the structure of the website, CSS is used to create a responsive and visually appealing design, and JavaScript handles interactive features and booking-related operations. Browser localStorage is used to retain booking information and display booking history on the same device. EmailJS is used for email-related functionality in the frontend prototype.

The main objective of E Booking is to provide a simple and accessible interface for movie ticket booking while demonstrating the practical use of frontend web technologies. The project includes movie browsing, booking forms, confirmation screens, and booking history. It is a frontend prototype and does not currently use a dedicated backend or centralized database.
